

Foul fungi

Fungi can be found everywhere but what are their favourite growing conditions? Your challenge is to investigate the optimum conditions for fungal growth.

You should choose foods which you think will be easily broken down, then decide on the different conditions in which to leave them.

What foods will you choose and why?	
Where will you leave the samples and why?	
What do you expect to discover?	
How will you ensure a fair test?	
How often will you observe the samples?	
How will you record your observations?	
For how long will you conduct the investigation?	
What did you discover? Did it match with your prediction?	
What can you conclude from your investigation?	
Would you alter anything about the investigation?	
How will you communicate the results of your investigation.
